Policy Statement

Council is committed to maintaining its unique visual character and identity through sustainable management of its Urban Forest. This includes:

- Integration of green elements within built infrastructure
- Conservation of our magnificent environment for the children and grandchildren of the future
- Balancing the protection, health and growth of the urban forest with the benefits and risks associated with it.

Policy

Purpose

The following guiding principles establish a high-level framework for the management of Ku-ring-gai's Urban Forest:

1. That Ku-ring-gai's Urban Forest is a valuable resource with significant economic, environmental and social benefits.
2. That our Urban Forest is intrinsically linked to Ku-ring-gai's cultural integrity and character and its protection and management is essential to the look, feel and liveability of Ku-ring-gai.
3. That the use of large canopy trees where planting opportunities exist, is essential for maintaining Ku-ring-gai's unique visual character.
4. That the Urban Forest is a component of Green Infrastructure, requiring appropriate planning and financial resources.
5. That a resilient Urban Forest plays a critical role in ecosystem health and urban ecology, and can help to mitigate human activities and adapt to climate change.
6. That the Urban Forest should be managed as a continuous resource regardless of ownership boundaries.
7. That urban forest management and protection be informed through the use of relevant legislation, policies, strategies standards, codes and approved guidelines.
8. That the Urban Forest is prioritised in development and management to facilitate community health and well-being.
9. That protection and management of the Urban Forest be supported and enhanced through the use of alternative engineering approaches that accommodate trees and other vegetation and provide for their long-term viability.
10. That risk to life, property, infrastructure and the environment be managed through best practice tree assessment, maintenance and planting in accordance with Council's adopted Risk Management System.
11. That structural diversity of the Urban Forest be maintained and protected through the maximisation of space for planting (including deep soil) and improvement in the quality of the growing environment.
12. That the health and condition of the Urban Forest be optimised by increasing species diversity and establishing a diverse age distribution of trees.
13. That sustainable Urban Forest targets/Indicators (including canopy coverage targets) be established and recognised as a provisional basis for monitoring the quality and quantity of Ku-ring-gai's Urban Forest.
14. That Monitoring and management of the Urban Forest be undertaken through a planned, systematic and integrated approach.
15. That partnerships, advocacy and community engagement are integral to effective Urban Forest management.

Scope

Council's Urban Forest Strategy, Urban Forest Replenishment Program and Urban Forest Monitoring Program will support this Policy and will provide the framework and resources for the management of the Urban Forest.

Responsibilities

This Policy applies to all sections of Council.

Council's Manager Technical Services has overall responsibility for compliance with this Policy. Implementation of this Policy is the responsibility of the General Manager and all Directors, Managers, Supervisors and Council Staff.

Definitions

Term	Definition
Age distribution	The varying life spans and growth rates within a tree population.
Canopy Coverage	An indicator of the quantity of urban forest often used as a measure of an urban forests general capacity to provide economic, social, environmental and aesthetic benefits
Ecosystem services	Ecosystem services are the benefits people obtain from ecosystems. These include provisioning services such as food and water; regulating services such as regulation of floods, drought, land degradation, and disease; supporting services such as soil formation and nutrient cycling; and cultural services such as recreational, spiritual, religious and other nonmaterial benefits ⁴ .
Green Infrastructure	The network of parks, reserves, gardens, nature strips and water systems (creeks, dams, water retention and stormwater management systems) that deliver environmental, economic and social values and benefits to urban communities. Including both natural and built elements such as green roofs (roof top gardens) and green walls (vertical gardens).
Other vegetation	Includes but not limited to shrubs, ferns, grass, vines, palms, tree ferns, epiphyte, cycads and xanthorrhoea.
Structural diversity	The various vegetation layers of the urban forest including groundcovers, shrubs and trees.
Urban Forest	All of the trees, other vegetation as well as the soil and water that support these. It includes the network of vegetation within both public and private ownership, encompassing the spectrum of vegetation growing within: <ul style="list-style-type: none"> Natural soils that exists independent of human involvement Altered soils, including gardens, bioretention basins, raingardens Engineered structures such as tree cells / vaults, vertical and roof top gardens
Urban Forest Management/ Urban forestry	- The management and minimisation of threats to the forest. - The science and art of managing trees, forests and natural ecosystems in and around urban communities to maximise the physiological, sociological, economic and aesthetic benefits that trees provide society ⁵ .
Urban Heat Island	An area that is significantly warmer than surrounding rural areas due to human activities.
